

地缘冲突下国际油价波动预测、宏观传导与中国政策韧性研究

摘 要

国际原油价格同时受到供需基本面、金融条件和地缘政治风险驱动，其冲击会沿进口成本、生产价格和居民消费价格等渠道向国内经济传导。本文围绕油价预测、冲突影响识别、中国宏观传导、政策缓冲和尾部风险压力测试构建四层分析框架。

写作提示：摘要应在正文定稿后重写。依次概括问题一至问题四的模型、关键数值结论与创新点，不得只重复题目；所有数值从冻结结果读取。本提示框和所有示例文字须在提交前删除。

关 键 词： 国际油价 地缘冲突 结构冲击 政策韧性 压力测试

一、 问题重述与研究目标

国际原油价格由供需基本面、美元与库存条件、市场预期和地缘政治风险共同决定。冲突发生后，供给中断预期和航运风险会先进入日度油价与波动率，再经汇率、进口成本和国内价格机制传导至PPI、CPI与工业活动。因此，题目中的“预测”“战争影响”“宏观传导”和“政策效果”不能由同一个统计量替代，必须在统一数据链上分别识别。

题面未给出“美伊战争”的精确边界。本文将其操作性定义为：2026年2月28日开始的中东军事行动及其引致的霍尔木兹海峡运输中断；2026年6月17日通行恢复谅解作为缓和阶段起点。2月28日为非交易日，事件研究映射到首个共同交易日2026年3月2日；3月5日再单列航运受阻阶段。3月23日和4月7日的国内临时调控属于政策事件，不与外部冲突合并编码。

据此，本文研究四个相互衔接的问题：

1. 以Brent现货价为主指标，在扩展窗口中比较未来1、3、6个月预测；以日度累计异常收益、状态匹配安慰剂和条件波动率识别冲突期异常，并用结构VAR分离供给、全球需求和石油特定风险冲击。
2. 以第一问的结构冲击为输入，估计人民币原油成本、PPI、CPI、工业增加值和汇率的响应方向、幅度、时滞及不确定性；季度GDP只作低频验证，不插值为月度数据。
3. 在可比数据边界内考察六个主要进口国的零售燃油传导，以及中国相对对照国的CPI与工业活动响应；再以中国受管制汽油调价指数代理构造“关闭2026年临时调控”的动态反事实。
4. 利用“包括但不限于”的开放性，估计极端油价条件尾部概率，并设计带自动追补与缺口硬约束的状态自适应价格平滑规则，为冲击期调价提供可检验的多目标方案。

本文区分四个时间概念：市场信息截止日为2026年6月30日；不同统计序列的实际观测末期由其发布滞后决定；数据发布或版本日期按来源单独记录；下载核验发生在2026年7月30日至31日。预测与回测只能使用对应原点当时可得的信息，不能把下载日误当作统一观测末期。

二、 问题分析与总体思路

2.1 四问的证据分工

第一问先检验模型能否降低样本外误差，再检验事件期是否偏离战前规律；预测残差和描述性基准差额均不能直接解释为战争净因果贡献。同一次油价上涨还可能来自供

给收缩、全球需求扩张或预防性需求，故进一步采用Kilian结构分解[1]，把具有经济含义的冲击送入第二问。

第二问采用变量特定的局部投影：同比变量直接估计未来水平响应，汇率估计相对冲击前基期的累计对数变化。只有完整月度路径才计算响应曲线面积，结构性稀疏的工业增加值期限不作伪累计。第三问先回答“数据允许我们比较什么”，再评价政策：六国官方零售燃油价用于正式传导排名；中国历史序列是调价指数代理，只作敏感性和政策路径构造。未经审计的年度缓冲代理不进入定量回归。第四问将油价分布、宏观压力与政策规则组织为相互关联但不可相加的三层证据。

总体路线见图1。

图1 国际油价冲击研究的总体技术路线

2.2 研究缺口与可验证创新

已有油价论文常把预测、冲击解释和政策评价混在同一误差项中；燃油价格平滑研究又容易只比较当期价格波动，而忽略被延期的调价责任。本文不以模型数量作为创新，而把每个新增环节都绑定到可复算输出和禁止表述，见表1。

2.3 数据结构与口径

月度主样本始于2010年1月。Brent、WTI、广义美元指数和人民币汇率由公开日度序列聚合；美国商业原油库存使用月末前最后一个已发布周值；GPR使用固定版本月度指数[2]。中国PPI、CPI和规模以上工业增加值来自国家统计局，工业增加值1至2月合并发布导致的空值原样保留。人民币原油成本由Brent美元价与人民币兑美元汇率相乘构造。

跨国模块包含中国、德国、法国、意大利、西班牙、日本和韩国。欧洲、日本和韩国使用官方可比的零售汽油价格；中国公开历史调价表被重建为“受管制汽油调价指数代理”，不冒充固定标准品零售价格。CPI统一转为同比，工业活动保留可比同比口径。核心数据见表2。

表1 研究缺口、本文改进与可验证证据

常见缺口	本文处理	可验证输出	边界
预测误差被解释为战争贡献	预测、CAR、SVAR和AR基准差额分层	Q1回测、placebo、结构贡献表	不称战争净因果溢价
油价上涨被视为单一负冲击	区分供给、全球需求和石油特定风险	Q2异质传导矩阵	不把需求涨价写成成本冲击
中国燃油价格层与他国不一致	主排名只用官方可比零售价，另做代理临界误差	Q3部分识别临界系数	不给中国正式价格排名
调价平滑只看短期通胀	SAPR同时约束宏观损失、CVaR、缺口和波动	Q4配对检验与路径图	不称全球福利最优
结论强度随结果显著性摇摆	每项主张绑定证据状态和禁止措辞	主张-证据-边界表	执行PASS不等于结论支持

表2 核心数据、频率和时间口径

数据模块	来源	原始频率	处理和证据用途
Brent、WTI、汇率	EIA/FRED[20, 21]	日度	交易日事件研究；自然月有效观测均值进入月度模型
库存和GPR	EIA；GPR数据库	周/月	月末前最后已发布库存值；固定版本GPR
中国宏观指标	国家统计局[22]	月/季	月度传导；季度GDP只作低频验证
六国宏观指标	OECD及各国官方[23]	月度	CPI和工业活动相对响应
六国燃油价格	欧委会、METI、KO-SIS/KNOC	周/月	官方零售价格月均值，进入正式排名
中国调价序列	公开调价表和官方公告	事件	历史调价指数代理；2026公告差额单独核验
中国价格政策	国家发展改革委[19]	事件	机制应调、实际调价和累计延期缺口

2.4 求解与验证策略

问题一以no-change为可用基线，将ARIMA、SARIMAX、ETS、Theta和等权组合置于相同扩展窗口；事件层采用状态匹配安慰剂，结构层执行平稳性、稳定性、残差和排序敏感性检查。问题二使用局部投影，以ARDL、冲击正负拆分、替代排序和季度GDP作边界验证。问题三采用分国分布滞后、相对中国的双固定效应面板及动态政策关闭反事实，三条宏观方程用共同时间块联合抽样。问题四以FHS–GJR–GARCH生成尾部分布；政策规则只在开发样本选择阈值和膝点，在2022年以后隔离检验样本用配对块bootstrap比较三类基线。所有结果经风险探针、数值冻结和正文一致性门禁后才允许进入论文。

三、 模型假设

1. **实时信息集假设。**预测原点之后的观测不进入估计、调参或阈值选择；统计序列按实际发布滞后截断。固定下载版本可能被后续修订，但不回填未来信息。
2. **交易日映射假设。**非交易日事件映射到其后首个共同交易日。短窗口仍可能叠加其他新闻，故CAR只解释为事件相关异常；常规正态区间为描述性结果，正式显著性依赖状态匹配安慰剂。
3. **递归结构识别假设。**月内全球供给响应最慢，全球真实活动可当期响应供给，实际油价可当期响应前两者。递归排序为“供给增长—全球真实活动—实际Brent收益”，并用替代排序探针检验结论依赖性。
4. **局部动态假设。**主要宏观响应在12个月内体现；PPI、CPI、IAV和原油成本的被解释量为未来水平，汇率为相对冲击前基期的累计对数变化。移动块bootstrap保留月度序列依赖。
5. **跨国可比边界。**六个对照国的官方零售燃油对数收益可以比较；中国调价指数代理与固定品零售价不可直接等同，因此不进入正式零售价格排名。面板系数只表示对照国相对中国的差异。
6. **局部政策反事实假设。**关闭临时调控时，将官方公告核验的应调与实调差额加入中国调价指数代理路径，其余宏观环境保持不变。反事实用0至6阶动态核及结果变量AR(1)递推，属于条件情景而非一般均衡福利估计。
7. **风险和规则约束假设。**FHS可重采样截止日前标准化残差；SAPR只在三状态、六个月、离散传导率规则族内寻优。平均缺口月负担为延期成本代理，不等于财政支出；最大缺口、期末缺口、恢复期末缺口和单月调价幅度分别作为硬约束。

四、 符号说明

下标 t 表示月份或交易日， h 表示预测或响应期限， i 表示国家。CPI、PPI和IAV分别指居民消费价格同比、工业生产者出厂价格同比和规模以上工业增加值同比。

五、 问题一：油价预测与冲突影响识别

5.1 扩展窗口预测

油价接近随机游走且结构突变频繁，复杂模型未必稳定优于简单基线[3, 4]。本文以2010年1月至2019年12月为初始训练段，自2020年1月起逐月扩展窗口，预测期限为

表3 主要符号及含义

符号	含义	单位或取值
P_t, r_t	Brent价格及对数收益 $r_t = \Delta \ln P_t$	美元/桶；无量纲
$CAR[0, H]$	事件日到第 H 个后续交易日的累计异常收益	对数收益
s_t^S, s_t^D, s_t^R	不利供给、全球需求与石油特定风险结构冲击	标准化冲击
$R_{y,h}$	冲击对结果 y 在期限 h 的响应	百分点或对数百分点
$A_y(H)$	完整月度响应曲线面积 $\sum_{h=0}^H R_{y,h}$	百分点月
$\Pi_{i,H}$	国家 i 的 H 月燃油传导率	无量纲
G_t	机制应调减实际调价形成的未调价缺口	元/吨
Δf_t	无调控路径相对实际路径的燃油收益差	对数百分点
$B_{y,t}$	无调控路径减实际路径的宏观差额	百分点
h_t	GJR–GARCH条件方差	日收益率平方
ρ_N, ρ_S, ρ_E	普通、压力、极端状态的调价传导率	[0, 1]
J_1	平均宏观损失	标准化损失
J_2	宏观损失的95%条件风险价值	标准化损失
J_3	平均每月未结缺口占基准价格比例	无量纲
J_4	实际调价路径波动	无量纲

$h \in \{1, 3, 6\}$ 。no-change基线为

$$\widehat{\ln P}_{t+h|t}^{NC} = \ln P_t. \quad (1)$$

候选模型包括ARIMA、使用滞后库存、美元与GPR的SARIMAX、ETS、Theta及等权组合。对每个模型和期限计算MAE、RMSE、方向准确率及80%、95%区间覆盖率，并用经HLN小样本修正的Diebold–Mariano检验比较配对误差[6, 7]。表4 给出全部模型相对no-change的RMSE；括号内为预注册门禁状态。

表4 扩展窗口回测的相对RMSE

模型	1个月	3个月	6个月
no-change	1.000（通过）	1.000（通过）	1.000（通过）
ARIMA	1.021（条件）	1.119（失败）	1.114（失败）
SARIMAX	1.025（条件）	1.104（失败）	1.101（失败）
ETS	1.159（失败）	1.215（失败）	1.270（失败）
Theta	1.001（条件）	1.003（条件）	1.007（条件）
等权组合	1.029（条件）	1.077（失败）	1.083（失败）

no-change在三个期限均取得最低RMSE，分别为0.1408、0.2660和0.3082，故选为主预测。以2026年2月均价70.887美元/桶为原点，三期点预测均为70.887美元/桶；2026年3月和5月实际均价为103.135和107.140美元/桶，2026年8月尚未实现，只保留为预测。该

结果说明极端事件超出了常规历史信息集，不能据此改用样本外表现更差的复杂模型。

来源：FRED/EIA 处理面板；由 code/problem1/run_q1.py 生成。

图2 Brent一月期扩展窗口预测与实际值

5.2 多阶段事件研究

日历事件E1为2026年2月28日；首个共同交易日为3月2日； $CAR[0, +2]$ 止于3月4日；航运受阻阶段E2从3月5日开始；缓和阶段E3从6月17日开始。用E1前520个共同交易日拟合Brent收益的AR(3)并控制美元收益，定义

$$AR_t = r_t - \hat{r}_t^0, \quad CAR[0, H] = \sum_{j=0}^H AR_{t_0+j}. \quad (2)$$

安慰剂不再随机抽普通周末，而是在排除事件邻域后，按事件前20日波动率、Brent价格水平和当月GPR距离选择最接近的40个历史状态。经验 p 值采用 $(b+1)/(B+1)$ ，避免有限样本下报告零概率。

表5 E1复合事件窗口的Brent累计异常收益

窗口	CAR	常规95%区间	状态匹配经验 p 值	结束日
[0]	0.0797	[0.0415, 0.1178]	0.0244	03-02
[0, +1]	0.1561	[0.1021, 0.2101]	0.0244	03-03
[0, +2]	0.1355	[0.0694, 0.2016]	0.0513	03-04

常规区间仅描述战前模型误差；正式有限样本证据以状态匹配经验 p 值为准。前两窗在5%水平异常，三日窗处于边界。由于军事行动、预期变化和首轮运输扰动密集重

叠，表中CAR是复合事件窗口，不能再分解为单一消息的净贡献。战前AR递归路径与实际价格之差记为 $ARBaselineGap$ ，也只表示偏离历史规律的描述性差额，不称为“无战争价格”。

5.3 结构冲击与波动

令 $z_t = (\Delta q_t, a_t, \Delta p_t^{real})^\top$ ，依次为全球供给增长、全球真实活动和实际Brent收益，估计递归VAR：

$$A(L)z_t = u_t, \quad u_t = B\varepsilon_t. \quad (3)$$

三序列均通过ADF拒绝单位根且KPSS不拒绝平稳：ADF的 p 值分别小于0.001、0.0053和0.001。BIC选择6阶VAR，最小特征根模为1.117，残差白噪声检验 $p = 0.382$ ，得到186个有效冲击月。为便于经济解释，将“供给冲击”统一定向为正值代表不利供给收缩。两个替代递归排序下关键价格冲击相关系数不低于0.999，说明本样本中排序探针不改变主要路径。

来源：EIA International、Dallas Fed IGREA、Brent、美国CPI；作者计算。

图3 递归VAR识别的三类月度结构冲击

为把事件证据和结构证据放在同一张答题图中，本文进一步构造图4。左侧显示40个状态匹配安慰剂的绝对CAR经验分布，真实 $CAR[0]$ 和 $CAR[0, +1]$ 均落在历史近邻分布的上尾；右侧使用同一递归VAR的移动平均表示分解2026年3月实际Brent收益。受冻结输入中全球液体供给实物月度值仅更新至2026年3月限制，本文只报告3月可审计结构贡献，不对4月至6月伪造分解。3月实际油价收益为36.45个百分点，模型冲击贡献合计为36.36个百分点，位于历史绝对贡献的98.4%分位；其中供给项贡献32.23个百分点，全

球需求和石油特定风险分别贡献1.00和3.13个百分点。该图的结论是“冲突首月处于给定SVAR识别下的历史高尾”，不是战争净因果份额。

来源：results/q1_placebo_distribution.csv、paper_extension_q1_historical_decomposition.csv；作者计算。

图4 E1事件异常与2026年3月结构贡献的证据合成

日度条件方差采用GJR–GARCH(1,1)[8]。战前条件波动率中位数为1.743%；E1即时窗、E2航运受阻阶段和E3缓和阶段分别为其1.587、2.214和1.566倍。航运受阻阶段压力最高，但该指标描述金融市场波动，不等同于实体损失。

5.4 问题一小结

预测层由no-change诚实胜出；事件层支持前两交易日出现状态条件下罕见的异常上涨；结构层输出三类经济冲击，波动层显示运输受阻阶段风险最高。四者用途分离，避免把预测误差、CAR或AR基准差额误写成战争净因果溢价。

六、 问题二：油价冲击对中国经济的传导

6.1 变量特定的局部投影

人民币原油成本构造为

$$C_t^{oil} = P_t^{Brent,USD} F X_t^{CNY/USD}, \quad c_t = 100 \Delta \ln C_t^{oil}. \quad (4)$$

结构冲击的来源不同，其宏观含义也不同[9, 10, 11]。本文分别输入不利供给、全球需求和石油特定风险冲击；未分解OilShock只作约化形式稳健性。局部投影不对整条脉冲路径施加强递推限制[5]，但被解释变量必须与程序定义一致。对PPI、CPI、IAV和人民币原油成本，估计未来水平响应

$$y_{t+h} = \alpha_h + \theta_h s_t + \rho_h y_{t-1} + \eta_h s_{t-1} + \Gamma_h^T Z_{t-1} + u_{t+h}; \quad (5)$$

对汇率则估计相对冲击前基期的累计变化

$$100(\ln FX_{t+h} - \ln FX_{t-1}) = \alpha_h + \theta_h s_t + \rho_h \Delta \ln FX_{t-1} + \eta_h s_{t-1} + \Gamma_h^\top Z_{t-1} + u_{t+h}. \quad (6)$$

Z_{t-1} 包含美元、GPR、月份虚拟变量和疫情阶段。PPI、CPI、成本和汇率估计 $h = 0, \dots, 12$ ；IAV 因 1 至 2 月结构性缺失，只估计 $h \in \{0, 3, 6, 12\}$ 。使用同源移动块 bootstrap 和最大 t 统计量构造 95% 联合置信带。对完整月度路径定义响应曲线面积

$$A_y(H) = \sum_{h=0}^H \hat{\theta}_{y,h}, \quad (7)$$

单位为“百分点月”，只描述离散响应曲线的面积，不称为累计经济损失。IAV 的四个稀疏期限不求和。

6.2 油价特定风险冲击结果

表6 油价特定风险冲击的传导指标

结果变量	极值	月份	极值联合95%区间	A(0, 6)	A(0, 12)
人民币原油成本	8.832	0	[6.888, 10.776]	7.440	4.939
PPI同比	0.762	10	[-0.159, 1.684]	3.655	7.401
CPI同比	0.247	7	[-0.096, 0.589]	0.877	2.155
IAV同比	-0.427	12	[-0.966, 0.111]	—	—
人民币汇率	0.771	12	[-0.488, 2.030]	1.612	5.846

成本入口当月响应最清晰；PPI和CPI点估计滞后上行，IAV在12个月出现负向点估计。但除成本入口外，极值的联合区间均跨零，故不能将点估计写成稳健总体增长损失。季度GDP在加入所需滞后后没有足够有效观测，低频验证状态为“结论不充分”，也不再报告旧版小样本回归值。

不同结构冲击的响应方向并不相同：全球需求扩张可同时推高油价和产出，不利供给或石油特定风险更符合成本推动机制。这解释了为何“油价上涨”不能直接等同于“经济受损”。ARDL、疫情剔除、冲击正负拆分和替代排序只作为稳健性探针；它们未把工业活动和GDP证据提升为联合显著。

6.3 三类冲击的异质传导比较

图6把三类结构冲击与四个核心变量放在同一矩阵中。油价特定风险冲击对人民币原油成本的当月响应为8.83个百分点，联合区间不跨零，是传导链中最稳健的入口；PPI、CPI和工业增加值虽然方向符合“成本上行-产出承压”的机制，但联合区间仍跨零。不

来源: 问题一结构冲击接口、国家统计局 IAV/PPI、OECD CPI、FRED 汇率/美元/GPR; 由 code/problem2/run_q2.py 生成。

图5 油价特定风险冲击下中国主要变量的局部投影响应

利供给冲击下PPI峰值点估计为0.71个百分点，工业增加值谷值为−0.32个百分点；全球需求冲击下PPI峰值为0.46个百分点，工业增加值谷值为−0.52个百分点。后者提示：需求扩张造成的油价上涨可能伴随外需或生产活动变化，不能和供给收缩导致的成本冲击合并解释。

来源：results/q2_transmission_metrics.csv；作者计算。

图6 三类结构冲击对中国成本、物价与工业活动的异质传导

表7 不同冲击下核心变量极值响应的解释矩阵

冲击来源	成本入口	PPI	工业增加值	论文解释
不利供给	3.96，跨零	0.71，跨零	−0.32，跨零	方向符合成本推动，但证据不足以写增长损失
全球需求	3.12，跨零	0.46，跨零	−0.52，跨零	油价上涨可能混入全球景气变化，需单独解释
石油特定风险	8.83，不跨零	0.76，跨零	−0.43，跨零	成本入口稳健，实体增长损失仍不充分

6.4 问题二小结

模型支持“进口成本快速响应、PPI和CPI滞后上行、工业活动可能承压”的传导顺序，但总体增长损失仍为结论不充分。后续政策评价必须同时报告物价、工业活动、响应期限和区间，不能只比较单一价格传导系数。

七、 问题三：中国政策缓冲与跨国比较

7.1 先锁定可比边界

跨国燃油传导受税制、汇率和定价机制共同影响[12, 13]。对每个国家估计

$$\Delta \ln F_{i,t} = a_i + \varphi_i \Delta \ln F_{i,t-1} + \sum_{j=0}^6 \beta_{i,j} \Delta \ln P_{i,t-j}^{Brent,local} + u_{i,t}, \quad (8)$$

并以 $\Pi_{i,H} = \sum_{j=0}^H \beta_{i,j}$ 表示 H 月传导率。德国、法国、意大利、西班牙、日本和韩国有可审计的固定品类零售燃油价格，进入正式排名。中国历史公开调价表只能重建出受管制汽油调价指数代理，不是固定标准品零售价格，因此从正式排名剔除，只保留为敏感性和政策路径构造。

来源：欧盟周度油价公报、日本METI、韩国KOSIS/KNOC、北京市发改委与 FRED；由 code/problem3/run_q3.py 生成。

图7 六国正式零售价格与中国调价指数代理的六个月传导率

表8 六个月燃油传导率及数据角色

国家	中国	德国	法国	意大利	西班牙	日本	韩国
传导率	0.373	0.237	0.198	0.217	0.248	0.199	0.237
数据角色	代理敏感性	正式	正式	正式	正式	正式	正式

六个正式对照国中位数为0.227。中国代理值0.373较高，但二者并非同类价格层，故不能据此判断中国更优或更差。这个“不可比”结论本身是重要的数据审计结果。

7.2 代理排名的临界误差与部分识别

为了把“不可比”从定性提醒改成可检验边界，定义中国真实固定品类零售价格传导率与调价指数代理之间的缩放关系

$$\Pi_{\text{CN,true}} = \kappa \Pi_{\text{CN,proxy}}. \quad (9)$$

以六国中位数0.227和中国代理值0.373计算，临界缩放系数为 $\kappa^* = 0.227/0.373 = 0.607$ 。这意味着：只有当真实固定品类零售价的六个月传导约低于调价指数代理变化的61%时，中国才可能落到六国中位数以下。长度为6个月的时间块bootstrap给出均匀缩放情形下 κ^* 中位数0.590，95%区间为[0.436, 0.834]；前置折价与后置折价扰动下区间分别为[0.461, 0.849]和[0.578, 1.169]。因此该计算只能量化代理误差需要多大，不能把中国重新放回正式国别排名。

来源：data/processed/model_country_monthly.csv、results/q3_country_pass_through.csv；作者计算。

图8 中国代理传导率进入正式排名所需的临界缩放系数

7.3 相对宏观响应与暂缓的机制回归

对CPI和工业活动估计含国家固定效应和完整年月固定效应的面板局部投影：

$$y_{i,t+h} - y_{i,t-1} = \alpha_{i,h} + \lambda_{t,h} + \delta_{i,h}(s_t I_i) + \Gamma_h^T Z_{i,t-1} + u_{i,t+h}. \quad (10)$$

中国是参照组， $\delta_{i,h}$ 只表示对照国相对中国的响应差，不能把中国绝对响应人为设为零。对照国减中国的CPI相对响应点估计中位数为0.245个百分点，工业活动为2.433个百分点；但当前程序没有形成联合国别–时间bootstrap区间，因此两项均判为“结论不充分”。价格监管、进口依赖、石油强度和进口来源集中度年度表均为未经审计代理，四类连续缓冲交互回归全部执行失败关闭，不提供系数、显著性或政策排序。三维核心韧性判据见表9。

表9 中国相对韧性的核心判据

维度	当前证据	判断
燃油价格	中国仅有调价指数代理，不能与六国固定品类零售价正式排名	条件代理
消费价格	对照国减中国点估计中位数0.245，缺联合差异区间	结论不充分
工业活动	对照国减中国点估计中位数2.433，缺联合差异区间	结论不充分
总体	任一核心维度均不足以形成稳健“更好”判断	结论不充分

7.4 关闭2026年临时调控的动态反事实

依据《石油价格管理办法》[19]和2026公告核验，3月汽油机制应调2205元/吨、实调1160元/吨，新增缺口1045元/吨；4月机制应调800元/吨、实调420元/吨，新增380元/吨，累计缺口1425元/吨。令 P_t^{no} 和 P_t^{act} 分别为无临时调控与实际代理价格路径，输入模型的不是静态价格水平差，而是逐月收益差

$$\Delta f_t = 100 \left[\ln \frac{P_t^{no}}{P_{t-1}^{no}} - \ln \frac{P_t^{act}}{P_{t-1}^{act}} \right]. \quad (11)$$

对 $y \in \{PPI, CPI, IAV\}$ ，用0至6阶动态核和结果变量AR(1)递推：

$$B_{y,t} = \sum_{\ell=0}^6 \beta_{y,\ell} \Delta f_{t-\ell} + \phi_y B_{y,t-1}. \quad (12)$$

三条方程使用同一组长度为6的循环时间块联合抽样，共接受2000组参数抽样，从而保留PPI、CPI和IAV估计误差的同期相关。

表10 2026年6月无临时调控减实际路径的宏观差额

变量	情景差额/百分点	95%区间	情景证据
PPI	2.596	[1.453, 3.633]	区间不跨零
CPI	0.414	[0.199, 1.088]	区间不跨零
IAV	-0.469	[-1.690, 0.672]	结论不充分

结果说明，在维持动态核与局部环境不变的条件下，临时调控可能降低了2026年6月PPI和CPI压力；IAV方向符合缓冲解释但区间跨零。该结论依赖调价指数代理，不能外推为全面福利改善，也不改变跨国总体韧性“结论不充分”的判断。

7.5 问题三小结

正式零售价格、相对宏观响应和政策反事实属于三类不同证据。当前数据不能证明中国在三维韧性上全面优于对照国；较强的结论只限于2026年条件情景中PPI与CPI的局

来源：results/q3_policy_macro_counterfactual.csv。

图9 关闭临时调控后的动态宏观情景差额

表11 政策工具、作用渠道与证据等级

政策工具	作用渠道	正文证据	证据边界
成品油价格监管	延缓原油成本向PPI和CPI传导，同时形成未调价缺口	2026年 动态 反 事实；PPI、CPI区间不跨零	条件情景，不等于福利评估
进口来源多元化	降低单一区域供给中断暴露	机制解释与数据审计	连续HHI未审计，不估计交互系数
石油进口依赖度	决定国际价格冲击进入国内成本的暴露度	文献机制与国别描述	年度代理不足以支持月度因果结论
石油强度	决定单位产出的燃油和运输成本敏感性	文献机制与产业链解释	不恢复未审计缓冲回归
战略储备、汇率与财政措施	通过库存释放、汇率稳定和补贴减轻短期压力	作为边界条件讨论	缺连续、可比强度数据，不作量化排序

部缓冲，同时必须显式记录1425元/吨延期缺口及其后续消化责任。

八、 问题四：极端油价风险与自适应调价规则

8.1 FHS–GJR–GARCH条件尾部分布

在2026年6月30日信息集下，先估计GJR–GARCH(1,1)，再从截止日前标准化残差经验分布有放回抽样，递归生成[16]

$$P_{t+k}^{(b)} = P_{t+k-1}^{(b)} \exp\left(\mu + \sqrt{h_{t+k}^{(b)}} z_{t+k}^{(b)}\right).$$
 (13)

每个期限模拟20000条路径。历史90%和95%价格分位111.397和115.550美元/桶只是压力阈值。

数据：EIA/FRED Brent；计算：FHS-GJR-GARCH 与高斯随机游走，信息截止 2026-06-30。

图10 固定信息集下的Brent条件尾部分布

表12 Brent条件风险预测

期限/月	中位数	90%区间	期末超过历史95%阈值	路径内曾越过
1	70.95	[53.41, 89.82]	0.27%	0.37%
3	71.46	[44.15, 103.41]	2.28%	3.76%
6	71.76	[37.15, 117.90]	5.56%	9.65%

回测从2022年起逐月滚动，共47个可用原点，而非只取少量季度末。FHS与高斯随机游走在1、3、6月的平均分位损失分别为1.565对1.629、2.367对2.562、3.519对3.689。配对长度6块bootstrap显示，FHS在3个月的80%和90%区间分数、6个月的80%区间分数显著较低；其余配对指标区间跨零。因此FHS对中期区间预测有局部优势，但没有在全部期限和全部评分上支配基线。

8.2 状态自适应价格平滑规则

设机制应调额为 Δ_t^{rule} ，按开发样本的75%和95%分位将其划为普通、压力、极端三态，传导率满足 $\rho_N \geq \rho_S \geq \rho_E$ 。实际调价与缺口递推为

$$a_t = \rho_{st} \Delta_t^{rule} + c_t, \quad G_t = G_{t-1} + \Delta_t^{rule} - a_t, \quad (14)$$

其中 c_t 为自动追补项：当缺口触及基准价格20%时优先压回安全区，并受单月调价25%硬约束。四目标定义为

$$\begin{aligned} J_1 &= \mathbb{E}(L), \\ J_2 &= CVaR_{0.95}(L), \\ J_3 &= \frac{1}{T} \sum_{t=1}^T \frac{|G_t|}{P_0}, \\ J_4 &= \text{sd}\left(\frac{a_t}{P_0}\right), \end{aligned} \quad (15)$$

分别衡量平均宏观损失、尾部宏观损失、平均缺口月负担和调价波动，其中CVaR采用Rockafellar–Uryasev定义[17]。 J_3 不是期末缺口，也不是财政支出。候选规则还必须同时满足

$$\max_t |G_t|/P_0 \leq 0.35, \quad |G_T|/P_0 \leq 0.20, \quad |G_{T+6}^{rec}|/P_0 \leq 0.05, \quad \max_t |a_t|/P_0 \leq 0.25. \quad (16)$$

表13 SAPR–CVaR枚举算法框

步骤	计算内容
1	输入2013年至2026年机制应调额、宏观响应核、协方差矩阵和开发样本阈值。
2	仅用2013年3月至2021年12月开发样本的正向应调额75%和95%分位判定普通、压力、极端状态。
3	对每组三状态传导率 (ρ_N, ρ_S, ρ_E) 按0.05步长枚举，并强制 $\rho_N \geq \rho_S \geq \rho_E$ 。
4	对每个六个月情景递推实际调价 a_t 与累计缺口 G_t ；降价先冲抵缺口，缺口触及20%安全线时自动追补。
5	检查最大缺口、期末缺口、恢复期缺口和单月调价幅度四项硬约束。
6	用2000组联合参数抽样传播燃油价格路径，计算PPI、CPI和IAV路径。
7	计算平均宏观损失、95% CVaR、平均缺口负担和调价波动率四个目标。
8	在1771组规则中筛选可行集、 ε -Pareto集，并按距归一化理想点最近确定唯一膝点。
9	将训练期选出的规则固定，在2022年至2026年隔离检验集与预注册基线比较。

阈值和规则只用2013年3月至2021年12月开发样本选择；2022年1月至2026年6月完全隔离。1771个候选中1750个满足硬约束；按1%容差构造 ε -Pareto集，得到119个规则，再选距归一化理想点最近的膝点。最优规则为

$$(\rho_N, \rho_S, \rho_E) = (0.30, 0.10, 0.10), \quad (17)$$

开发样本阈值为435.97和702.49元/吨，基准价格为9504元/吨。

来源：results/q4_sapr_policy_grid.csv；作者计算。

图11 可行规则的四目标映射与 ε -Pareto膝点

表14 2022年至2026年隔离检验样本的原始目标值

策略	J_1	J_2	J_3	J_4
完全传导	0.315	1.957	0.000	0.050
固定75%平滑	0.281	1.792	0.005	0.044
2026临时调控近似	0.294	1.768	0.003	0.043
SAPR膝点	0.165	1.198	0.022	0.035

8.3 隔离检验与政策权衡

与完全传导相比，膝点规则的 J_1 、 J_2 和 J_4 配对差分别为−0.163、−0.671和−0.0148，95%区间均小于零； J_3 差为+0.0222，区间[0.0109, 0.0386]，明确揭示平滑的延期负担。检验期最大缺口被自动限制在20%，再给6个月恢复后降至2.35%，满足5%硬约束。结果支持的是注册规则族内的短期风险–延期负担权衡，不是全体政策的全局最优或完整福利改进。

2026年实际冲击路径显示，SAPR在PPI和CPI上形成较低的短期压力，但以累计缺口上升为代价；缺口路径触及20%最大缺口约束后进入追补，并在六个月恢复期内回到5%约束以内。图13因此同时给出改善方向和政策代价，避免把“调价平滑”解释为没有成本的收益。

来源：results/q4_sapr_holdout_paired_summary.csv；作者计算。

图12 SAPR相对完全传导的隔离检验配对目标差

来源：results/q4_sapr_macro_paths.csv；作者计算。

图13 2026年实际冲击情景下SAPR与完全传导的宏观路径和缺口约束

8.4 问题四小结

六个月路径越过历史95%高位阈值的条件概率为9.65%。SAPR用显式缺口硬约束和自动追补把短期物价与工业压力的降低同未来调价责任绑定；其优势体现在 J_1 、 J_2 和 J_4 ，代价体现在 J_3 。这比单纯“压低当期价格”更完整，也保留了退出机制。

九、 稳健性与敏感性分析

9.1 预测、识别与传导探针

问题一将六类预测器置于78个相同目标月比较；no-change在三个期限均取得最低RMSE，Theta虽接近，DM-HLN检验未显示稳定优势。事件CAR改用40个前期波动率、价格水平和GPR状态最接近的安慰剂，最小可实现经验 p 值为 $1/41 = 0.0244$ ，避免普通周末样本造成虚假精度。结构VAR的6、12、18、24阶候选均检查稳定性；6阶模型白噪声检验通过，替代排序下关键价格冲击相关系数不低于0.999。

问题二使用联合最大 t 置信带、逐点区间、FDR校正、ARDL、疫情剔除和冲击正负拆分。多数PPI、CPI和IAV联合区间跨零，GDP有效观测不足，因此稳健性分析的作用是限制结论强度，而不是事后挑选显著规格。问题三四个年度缓冲变量因未经审计统一判为“主分析失败”，不以替代规格恢复定量结论。

9.2 尾部风险回测

FHS与高斯随机游走使用相同的47个月度原点和1、3、6个月期限。除分位损失和覆盖率外，补充80%、90%区间分数与近似CRPS[18]。长度6的配对块bootstrap显示：FHS仅在3个月两档区间分数和6个月80% 区间分数上显著更优，其余差异为结论不充分。由此将“FHS全面优于基线”列为禁止表述。

9.3 SAPR规则敏感性

表15 SAPR膝点对阈值、权重和块长度的敏感性

变体	(ρ_N, ρ_S, ρ_E)	Pareto数	相对默认变化	检验期非支配
默认75/95阈值	(0.30, 0.10, 0.10)	119	否	是
70/90阈值	(0.30, 0.15, 0.10)	82	是	是
80/97.5阈值	(0.30, 0.10, 0.10)	209	否	是
CPI权重增加20%	(0.30, 0.10, 0.10)	121	否	是
IAV权重增加20%	(0.30, 0.10, 0.10)	116	否	是
bootstrap块3/6/12	(0.30, 0.10, 0.10)	119	否	是

除较低状态阈值外，膝点规则对权重、阈值上界和块长度保持不变；70/90阈值把压力期传导率提高到0.15，说明普通与压力状态的划分是最敏感设计项。所有变体在检验期点估计上保持非支配，但正文的“支持”判断还依赖配对目标差和硬约束，而不只依赖非支配概率。

9.4 主张–证据–边界核对

为了避免把程序运行通过误写成结论成立，最终表述统一按“支持、部分支持、结论不充分”给出。表16列出正文允许使用的核心主张、证据来源和禁止外推。

表16 核心主张、证据状态与禁止表述

主张	证据状态	正文可写表述	禁止表述
Q1预测模型选择	支持	no-change在冻结回测中是最优主预测，高级模型未稳定战胜基线。	ARIMA或SARIMAX显著优于基线。
Q1事件冲击	部分支持	E1短窗口CAR处于匹配placebo分布尾部，3月结构贡献在历史高分位。	AR基准差额等于战争净因果贡献。
Q2宏观传导	结论不充分	三类冲击方向和量级可复算，多数联合区间跨零。	中国已经出现稳健增长损失。
Q3跨国韧性	结论不充分	中国价格代理可做边界分析，正式排名只覆盖六个可对照国。	中国在跨国比较中显著优于所有对照国。
Q3政策情景	部分支持	2026临时调控在条件反事实下降低PPI和CPI压力。	未调价差额等于财政成本或完整福利收益。
Q4自适应规则	支持	SAPR在注册规则族和隔离检验中改善 J_1 、 J_2 、 J_4 并增加 J_3 。	SAPR是全球最优成品油政策。

十、 模型评价与推广

10.1 主要优点

1. 证据层分离。预测误差、事件异常、结构冲击、宏观响应和政策情景分别建模，避免把同一个差额反复解释为因果贡献。
2. 实时和样本外约束。预测扩展窗口、47个风险回测原点以及SAPR开发–检验拆分均禁止未来信息；所有复杂方法都有可运行的简单基线。
3. 单位和响应定义可审计。程序为每个Q2结果声明被解释量；完整路径只报告响应曲线面积，IAV稀疏期限不伪造累计量。
4. 数据不可比时主动降级。中国燃油调价指数代理不进入正式零售排名；未经审计缓冲代理触发失败关闭，而不是生成看似完整的回归表。
5. 政策优化显式计入退出责任。平均缺口月负担与最大、期末、恢复期末缺口分开；自动追补保证平滑规则不会无限累积延期调整。

10.2 局限性

1. 单次地缘冲突与同期消息密集重叠，状态匹配CAR仍不是严格随机实验；递归VAR也依赖排序和历史代理变量。
2. 中国固定标准品零售价、战略储备释放、财政补贴、炼油企业损益和进口来源年度数据不完整，限制了跨国韧性与机制解释。
3. Q2月度样本有限，宏观联合区间较宽；季度GDP在滞后要求下无法形成有效回归，不能声称稳健总体增长损失。
4. FHS只能重采样历史残差，不能生成历史从未出现的制度断裂；GJR持久性较高，远期尾部对模型设定敏感。
5. SAPR只在注册的三状态、六个月和离散传导率族内最优， J_3 既不是财政成本，也不是完整福利。

10.3 推广方向

该框架可用于天然气、粮食、关键矿产和国际运价：先比较样本外预测，再识别事件异常与结构来源，继而估计国内传导，最后在明确硬约束下优化缓冲规则。若能获得连续的官方零售价格、储备操作、行业投入产出和财政成本数据，可把局部政策情景扩展为部门异质性或一般均衡分析；新增模块仍需通过基线、风险探针和数值冻结门禁。

十一、 结论与政策启示

11.1 主要结论

第一，扩展窗口回测中no-change在1、3、6个月均取得最低RMSE。E1复合事件的 $CAR[0]$ 、 $CAR[0, +1]$ 和 $CAR[0, +2]$ 分别为0.0797、0.1561和0.1355；状态匹配经验 p 值分别为0.0244、0.0244和0.0513。航运受阻阶段条件波动为战前中位数的2.214倍。这些结果支持事件附近出现异常，但不等同于战争净因果溢价。

第二，石油特定风险冲击使人民币原油成本当月上升8.832个对数百分点；PPI和CPI极值点估计为0.762和0.247个百分点，IAV谷值为-0.427个百分点。除成本入口外，极值联合区间均跨零；GDP有效观测不足，故总体增长损失证据为结论不充分。

第三，中国历史燃油序列是调价指数代理，不能与六国固定品类零售价正式排名；CPI与工业活动的相对响应缺联合差异区间，三维跨国韧性总体判断为结论不充分。条件动态反事实显示，关闭2026年临时调控后，6月PPI和CPI可能分别高2.596和0.414个百分点；IAV差额为-0.469个百分点但区间跨零。该缓冲同时留下1425元/吨延期缺口。

第四，在2026年6月30日信息集下，六个月Brent中位数为71.76美元/桶，期末超过历史95%阈值的条件概率为5.56%，路径内曾越过的概率为9.65%。SAPR在1750个可行规则中选出 (0.30, 0.10, 0.10)；检验期相对完全传导显著降低平均宏观损失、尾部宏观损失和调价波动，但平均缺口月负担增加0.0222。最大缺口被限制在20%，6个月恢复后为2.35%。

11.2 政策启示

1. **临时平滑必须状态依赖且透明。**以机制应调额和条件尾部风险作为触发信号，公开状态阈值、传导率、累计缺口和退出条件，避免临时措施固化为长期冻结。
2. **把延期负担列入同一政策仪表盘。**当期CPI下降并不代表成本消失，应同步监测未调价缺口、炼油企业现金流、库存和财政安排，并在国际油价回落期自动追补。
3. **实施价格—物价—工业活动联合预警。**人民币原油成本是清晰先行入口，PPI、CPI和IAV反映不同滞后层；政策报告应同时给出点估计、联合区间和冲击来源。
4. **优先补齐可审计公开数据。**连续固定品类成品油价格、储备操作、进口来源和政策成本数据，是把当前条件情景提升为跨国因果与福利评价的关键。

综上，稳健策略不是永久隔离国际价格信号，而是在冲击期用可审计、可退出的状态规则降低短期尾部传导，并把被推迟的调整责任显式纳入决策。

AI工具使用说明

本文在公开数据检索提示、程序调试、结果一致性检查和文字修改环节使用了OpenAI Codex。研究问题定义、模型取舍、数据口径、结果核验和最终表述均由参赛队独立判断并承担责任；详细交互用途、采纳与人工修改情况见支撑材料《AI工具使用详情》。

附录 A 主张、证据与边界

表17 核心主张的证据链和禁止外推

主张	直接证据	边界
冲突初期存在异常上涨	状态匹配CAR: 前两窗经验 $p = 0.0244$	复合事件关联，不是战争净因果溢价
成本入口响应清晰	原油成本当月8.832, 联合区间不跨零	不等于PPI、CPI或产出必然显著变化
宏观传导存在但增长损失不稳健	PPI、CPI、IAV点估计符合机制，联合区间多跨零	禁止表述为稳健总体GDP损失
2026政策可能缓冲物价	动态代理反事实PPI、CPI区间不跨零	依赖调价指数代理，不是一般均衡福利
中国跨国韧性尚不能定论	零售价不可比，宏观相对响应缺联合区间	禁止声称全面优于六国
SAPR改善短期风险指标	检验期 J_1 、 J_2 、 J_4 配对差显著为负	J_3 显著增加；仅在注册规则族内成立

附录 B 复现流程和支撑材料文件列表

建议按“数据下载或人工导入—数据构建—P0校验—Q1—面板重建—Q2—Q3—Q4风险层—Q4 SAPR—论文交接—数值冻结—冻结验证”顺序执行。随机种子为20260730；市场信息截止日为2026-06-30，各序列实际末期以数据字典为准。

表18 支撑材料文件列表

文件或目录	内容和用途
data/SOURCE_REGISTRY.csv	来源网址、下载日期、访问条件、许可和回退口径
data/DATA_DICTIONARY.csv	变量定义、频率、单位、实际末期、发布滞后和主分析状态
data/event_timeline.csv	冲突、航运、国内调控和缓和事件的日期与来源
code/data_download/	免费公开数据下载程序
code/data_processing/	人工数据导入、面板构建和P0数据校验
code/problem1/	预测、CAR、状态匹配安慰剂、结构冲击和条件波动
code/problem2/	变量特定局部投影、ARDL和稳健性探针
code/problem3/	跨国比较、代理数据门禁和动态政策反事实
code/problem4/	尾部风险回测和SAPR-CVaR优化
results/frozen_numbers.json	论文冻结数值、源文件哈希和定稿门禁
results/risk_probe_summary.json	基线、风险探针、证据等级和禁止声明
results/reproducibility_manifest.json	输入、代码、输出哈希及运行环境
reports/paper_numbers.csv	正文关键数字、单位、舍入规则和表述边界
support_materials目录下《AI工具使用详情.pdf》	AI工具、用途、关键交互和人工修改记录

附录 C 全部完整源程序代码

下列代码与支撑材料中的源文件一致。编译时直接读取仓库文件，避免论文代码副本与实际运行版本分叉。

975 >
976 > 观测截止日：2026-06-30
977 >
978 > 本报告评价数据管线；模型风险探针状态另以 `results/risk_probe_summary.json` 为准。
979
980 ## 1. 结论
981
982 - 自动来源已形成可复现快照、SHA-256 登记和处理后数据。
983 - 月度主区间 2010-01 至 2026-06 共 {expected_months} 个月；Brent、美国商业原油库存、美元指数和 GPR 四项共同非缺失期为 {common_complete}
    个月。
984 - OECD 整体 CPI 覆盖中、日、韩、德各 198 期；OECD 工业生产覆盖日、韩、德各 197 期。
985 - EIA 2026 年 7 月 STEO 当前文件只覆盖 2022 年起，且包含估计/预测区间。它不能直接回填 2010 年起的历史滚动预测，主 ARIMAX 暂按既定回退删除
    全球供需变量。
986 - 德国含税 Euro-super 95、日本普通汽油全国现金价和韩国普通汽油全国月均价均已进入处理层；韩国 KOSIS 序列覆盖 2010-01 至 2026-06 共 198
    期。
987 {nbs_conclusion}
988
989 ## 2. 数据集级检查
990
991 {chr(10).join(table_lines)}
992
993 状态汇总：`PASS`={status_counts.get("PASS", 0)}、`CONDITIONAL`={status_counts.get("CONDITIONAL", 0)}。
994
995 ## 3. 信息集与发布滞后
996
997 `data/processed/release_date_matrix.csv` 已从变量字典生成，共 {len(release_matrix)} 个变量接口。当前只完成规则级矩阵，尚未补齐所有来源的
    逐期实际发布日期。
998
999 必须遵守：
1000
1001 1. 完整月均值只能在该月结束后使用。
1002 2. GPR 的当月值按次月初版本可用，近期值允许修订。
1003 3. STEO 单一最新版本不得用于伪造历史实时信息集。
1004 4. OECD API 未返回逐期发布日期时，预测探针先保守滞后一个月。
1005 5. 国家统计局手工导出文件按原始快照、下载日期和 SHA-256 保存；工业增加值结构性空值不得插值。
1006

```

```

1007 ## 4. 主线放行与回退项
1008
1009 | 条目 | 状态 | 回退 |
1010 | --- | --- | --- |
1011 {nbs_gate}
1012 | 中国原油进口实际单位价值 | `CONDITIONAL` | 主变量使用 Brent 月均价乘人民币兑美元汇率 |
1013 | STEO 2010 年起实时版本 | `CONDITIONAL` | ARIMAX 主规格删除全球供需，保留实际库存、美元和 GPR |
1014
1015 ## 5. 下一门禁
1016
1017 数据处理后应重新运行 Q1/Q2/Q3 风险探针并更新 `results/risk_probe_summary.json`：有已验证回退且不承担主线任务的条件项不阻塞模型运行。

822
823     text = f"""# 建模到论文移交说明
824
825 [PAPER_READY]
826
827 原题三问与自拟问题四的建模、检验、数值冻结和论文移交材料已完成。当前 `overall_status={risk['overall_status']}`, `paper_finalize_allowed={
828     str(risk['paper_finalize_allowed']).lower()}`, 阻塞门禁数为 {len(risk['blocking_probe_ids'])}。
829
830 ## 验证命令
831
832 ```powershell
833 python code\\utils\\freeze_results.py
834 python code\\utils\\verify_freeze.py
835 python code\\utils\\verify_freeze.py --require-final
836 ```
837
838 最后一次运行结果均为 `PASS`。论文所有数字优先引用 `results/frozen_numbers.json`、`results/final_numbers.json` 和 `reports/paper_numbers.csv`。
839
840 ## 问题一：预测与战争影响
841
842 主线：`no_change` 作为诚实胜出的主预测模型，交易日 CAR 与周末匹配 placebo 作为事件相关异常证据，递归 SVAR 提供三类结构冲击。
843
844 核心写法：
845 {chr(10).join(q1_rows)}
846 {chr(10).join(car_rows)}
847
848 可用图表：`figures/q1_forecast_1m.png`、`figures/q1_war_counterfactual.png`、`figures/q1_structural_shocks.png`、`figures/paper_event_timeline.png`。
849
850 禁止写法：不得把 `ARBaselineGap` 称作严格战争净贡献；不得把 ARIMA/SARIMAX 未胜出解释成建模失败。
851
852 ## 问题二：中国经济增长传导
853
854 主线：结构性油价冲击 → 人民币原油成本 → PPI → CPI/工业增加值 → 季度 GDP 验证。
855
856 油价特定风险冲击下的摘要：
857
858 {chr(10).join(q2_rows)}
859
860 结论边界：当前总体仍应写成“尚未发现稳健的总体增长损失证据”。若正文使用“增长损失”，必须同时满足工业活动负响应且联合区间排除零。
861
862 可用图表：`figures/q2_irf.png`、`figures/q2_transmission_chain.png`、`figures/paper_transmission_mechanism.png`。
863

```

```

864 ## 问题三：中国政策与跨国比较
865
866 主线：中国历史燃油序列统一作为受管制汽油调价指数代理并退出正式价格水平排名；CPI/IAV面板只估计六个对照国相对中国的响应差；待审计缓冲交互不
      发布定量结果；2026政策关闭情景在明确标注的代理层上动态传播至PPI/CPI/IAV。
867
868 综合韧性判断：`{resilience_overall}`。
869
870 {chr(10).join(q3_rows)}
871
872 政策关闭宏观反事实：
873
874 {chr(10).join(q3_macro_rows)}
875
876 可用图表：`figures/q3_pass_through_6m.png`、`figures/q3_panel_irf.png`、`figures/q3_resilience_metrics.png`、`figures/
      q3_policy_macro_counterfactual.png`、`figures/paper_policy_counterfactual_flow.png`。
877
878 禁止写法：不得仅凭价格传导或中国单一价格监管变量宣称“中国显著更好”；不得把价格平滑写成无成本福利改善。
879
880 ## 问题四：极端油价尾部风险、政策压力测试与自适应调价规则优化
881
882 定位：该部分作为论文正式自拟问题四，不再设置其他自拟问题。问题四由两个互补模块构成：同事已有的 FHS - GJR-GARCH 尾部风险与宏观政策压力测试
      负责回答“极端冲击有多大概率、会形成多大压力”；本轮 SAPR-CVaR 自适应调价优化负责回答“在现行机制约束上应如何设置状态依赖的临时平滑
      层”。油价概率、Q2 结构冲击宏观情景、Q3 已实现政策反事实和 SAPR 策略优化是递进关系，不可简单相加为单一因果贡献。
883
884 FHS - GJR-GARCH 条件尾部预测：
885
886 {chr(10).join(q4_price_rows)}
887
888 与高斯随机游走的同口径滚动回测：
889
890 {chr(10).join(q4_backtest_rows)}
891
892 95%分位油价特定风险结构冲击的宏观压力：
893
894 {chr(10).join(q4_macro_rows)}
895
896 2026年已实现临时调控的政策缓冲重述：
897
898 {chr(10).join(q4_policy_rows)}
899
900 SAPR-CVaR 自适应调价规则：
901
902 {q4_sapr_rule_text}
903
904 隔离检验样本策略比较：
905
906 {chr(10).join(q4_sapr_holdout_rows)}
907
908 2026实际冲击情景策略比较：
909
910 {chr(10).join(q4_sapr_2026_rows)}
911
912 敏感性检验：
913
914 {chr(10).join(q4_sapr_sensitivity_rows)}
915
916 证据状态：`{q4_sapr_summary['evidence_status']}`；检验期非支配 bootstrap 概率为 `{q4_sapr_summary['holdout_non_dominated_probability']:.3
      f}`。
917
918 可用图表：`figures/q4_price_tail_risk.png`、`figures/q4_macro_policy_stress.png`、`figures/q4_sapr_pareto_front.png`、`figures/
      q4_sapr_policy_heatmap.png`、`figures/q4_sapr_strategy_comparison.png`、`figures/q4_sapr_2026_macro_paths.png`。
919
920 禁止写法：不得把尾部概率写成确定结果，不得把宏观情景写成确定性 GDP 损失，不得把 Q2 条件响应与 Q3 政策差额相加为单一因果贡献；不得把 SAPR
      的注册规则族最优写成全球最优、完整福利收益或财政成本估计。
921
922 ## 论文接手顺序
923
924 1. 先按 `reports/paper_numbers.csv` 抽取数值，填入摘要、问题重述、模型假设和结果表。
925 2. 四个问题均按“目标—数据—公式—估计—结果—检验—解释边界”写；问题四单列为自拟问题，明确从前三问结果递进而来。
926 3. 所有图表从 `figures/` 选择 PNG 入文，PDF 留作高清备份。
927 4. 写作期间如改动模型代码、输入数据或核心结果，必须重新运行冻结和 `--require-final`。

1585
1586 ## Material Passport
1587
1588 - Origin Skill: `math-modeling-solver + math-modeling-paper`
1589 - Execution Mode: `{execution_mode}`
1590 - Verification Status: `{risk_summary['overall_status']}`
1591 - Paper Finalize Allowed: `{str(risk_summary['paper_finalize_allowed']).lower()}`
1592 - Cutoff: `{CUTOFF}`
1593 - Random Seed: `{RANDOM_SEED}`
1594
1595 ## 1. 总体结论
1596
1597 {conclusion_text}
1598
1599 {boundary_text}
1600
1601 当前阻塞定稿的门禁：
1602
1603 {chr(10).join(blocker_lines)}
1604
1605 ## 2. 问题一：预测与事件窗口
1606
1607 月度预测表已经加入相对基线指标和逐模型状态。当前主预测模型是 `no_change`。
1608
1609 {markdown_table(q1_metrics.sort_values(['horizon', 'model']) if not q1_metrics.empty else q1_metrics, ['model', 'horizon', 'RMSE', '
    relative_RMSE_vs_no_change', 'dm_hln_pvalue_rmse_loss', 'model_status'])}
1610
1611 以 2026-02 为原点的竞赛最终预测表如下。2026-08 在数据截止日之后，保留为 `FORECAST_ONLY`。
1612
1613 {markdown_table(q1_origin.sort_values('horizon_months') if not q1_origin.empty else q1_origin, ['origin_period', 'target_period', '
    horizon_months', 'model', 'forecast_status', 'origin_price', 'prediction_price', 'actual_price', 'forecast_error_price'])}
1614
1615 历史结构冲击使用递归 VAR/Cholesky 分解，变量排序为“全球供给增长 → 全球真实经济活动 → 实际 Brent 收益”。被选规格如下：
1616
1617 {markdown_table(q1_svar.loc[bool_series(q1_svar['is_selected'])] if not q1_svar.empty and 'is_selected' in q1_svar else q1_svar, ['
    candidate_lags', 'is_selected', 'bic', 'is_stable', 'whiteness_pvalue', 'sample_start', 'sample_end', 'nobs'])}
1618
1619 GJR-GARCH 条件波动率用于描述战争阶段油价波动变化，不作为战争净因果效应。
1620
1621 {markdown_table(q1_vol_summary, ['war_stage', 'trading_days', 'conditional_vol_pct_median', 'vol_multiple_vs_pre_median', '
    evidence_status'])}
1622
1623 E1 已从 2026-02-28 周末映射到 2026-03-02 交易日，同时输出 CAR[0]、CAR[0,+1]、CAR[0,+2] 和匹配周末 placebo 经验 p 值。经验 p 值采用  $((b+1)/(B+1))$  的有限样本修正，不报告严格的 0。
1624
1625 {markdown_table(q1_events.loc[q1_events['model'].isin(['brent_usd_bbl_stage_dummy', 'brent_usd_bbl_event_car'])].sort_values(['model', '
    stage_id']) if not q1_events.empty else q1_events, ['model', 'stage_id', 'estimate_log_return', 'std_error', 'lower_95', 'upper_95',
    'pvalue', 'pvalue_empirical', 'event_observations'])}
1626
1627 ## 3. 问题二：中国宏观传导
1628
1629 国家统计局 IAV/PPI 官方历史已经进入处理层，其中工业增加值有 {nbs_iav_count} 个真实观测，PPI 有 {nbs_ppi_count} 个真实观测；官方 1—2 月结
    构性空值保持为空，不做插值。Q2 当前只能写为“尚未发现稳健的总体增长损失证据”，所有结果仍需带区间与识别 caveat 报告。
1630
1631 {markdown_table(q2_irf.loc[q2_irf['horizon'].isin([0, 6, 12])].sort_values(['outcome', 'shock', 'horizon']) if not q2_irf.empty else
    q2_irf, ['outcome', 'shock', 'horizon', 'response', 'lower_95', 'upper_95', 'joint_lower_95', 'joint_upper_95', 'fdr_qvalue', '
    inference_band'])}
1632
1633 传导链摘要按冲击—变量输出峰值/谷值、累计响应和证据状态。当前即使部分点估计方向符合直觉，也不自动升级为“增长损失”结论。
1634
1635 {markdown_table(q2_metrics.loc[q2_metrics['shock'].isin(['supply_shock', 'aggregate_demand_shock', 'oil_specific_risk_shock'])].
    sort_values(['shock', 'outcome']) if not q2_metrics.empty else q2_metrics, ['shock', 'outcome', 'extremum_type', 'extremum_response',
    'extremum_month', 'response_curve_area_0_6', 'response_curve_area_0_12', 'area_unit', 'evidence_status', '
    allows_growth_loss_language'])}
1636
1637 季度 GDP 只作低频验证，不插值成月度变量。
1638
1639 {markdown_table(q2_gdp, ['outcome', 'estimate', 'lower_95', 'upper_95', 'pvalue', 'n', 'sample_start', 'sample_end'])}
1640
1641 ## 4. 问题三：政策缓冲与跨国比较
1642
```

1643 跨国燃油主排名只纳入覆盖充分且价格层可解释的观测零售汽油价格。中国历史路径是受管制汽油调价指数代理，只保留为敏感性材料；2026政策公告差额
单独核校。

1644

1645 {markdown_table(q3_main.loc[q3_main['horizon'].eq(6)].sort_values('country') if not q3_main.empty else q3_main, ['country', 'horizon', '
response', 'lower_95', 'upper_95', 'price_measure_type', 'included_in_main_comparison'])}

1646

1647 综合韧性指标把燃油传导、CPI 相对响应、工业活动相对响应和政策关闭情景放在同一口径下判断。当前总体判断为 `PARTIAL`，不是无条件支持“中国显
著更好”。

1648

1649 {markdown_table(q3_resilience, ['dimension', 'metric', 'horizon', 'china_value', 'control_median', 'china_vs_control_median_diff', '
diff_lower_95', 'diff_upper_95', 'judgement', 'overall_china_resilience_judgement'])}

1650

1651 中国政策图与数据表已区分新增差额和累计差额，2026-04 的累计差额为 1425 元/吨，4月新增为 380 元/吨。

1652

1653 {markdown_table(q3_policy, ['period', 'policy_adjusted_official_cny_t', 'no_temporary_control_official_cny_t', '
incremental_gasoline_gap_cny_t', 'cumulative_gasoline_gap_cny_t', 'cpi_counterfactual_gap_pctpt', 'price_layer_status'])}

1654

1655 政策关闭宏观情景在明确标注的调价指数代理层上，将2026临时调控收益差通过0—6阶核和结果变量递归传播到PPI、CPI与IAV；区间来自三方共同时间块
重采样。

1656

1657 {markdown_table(q3_policy_macro.loc[q3_policy_macro['period'].eq('2026-06')].sort_values('outcome') if not q3_policy_macro.empty else
q3_policy_macro, ['period', 'outcome_label', 'macro_counterfactual_gap_pctpt', 'lower_95', 'upper_95', 'price_layer_status', '
evidence_status'])}

1658

1659 ## 5. 问题四：极端油价尾部风险、政策压力测试与自适应调价规则优化

1660

1661 问题四把同事已完成的“尾部风险与压力测试”作为风险输入层，并把本轮 SAPR-CVaR 自适应调价规则作为政策优化层：先判断极端油价路径概率与宏观压
力，再回答我国成品油调价机制在极端冲击下应如何状态依赖地平滑传导。油价概率层以 2026-06-30 最后交易日为原点，比较 FHS-GJR-GARCH 与
恒定波动高斯随机游走；历史 90%/95%价格分位只作为上行压力阈值。

1662

1663 {markdown_table(q4_risk.sort_values(['model', 'horizon_months']) if not q4_risk.empty else q4_risk, ['model', 'horizon_months', '
median_price', 'p05_price', 'p95_price', 'terminal_prob_above_hist_p90', 'terminal_prob_above_hist_p95', 'path_prob_cross_hist_p95
'])}

1664

1665 滚动回测在同一原点、期限和评价口径下比较主方法与基线；主方法是否胜出由分位损失和覆盖率共同判断，不因预设方法而更换回溯区间。

1666

1667 {markdown_table(q4_backtest.sort_values(['horizon_months', 'model']) if not q4_backtest.empty else q4_backtest, ['model', 'horizon_months
, 'origins', 'mean_pinball_loss', 'median_absolute_error', 'coverage_80', 'coverage_90', 'mean_width_90'])}

1668

1669 宏观压力层使用 Q1 油价特定风险冲击的历史正向分位数缩放 Q2 IRF。下表只展示 95%分位冲击的 6、12 月条件响应；联合区间跨零时继续标记为 `INCONCLUSIVE`。

1670

1671 {markdown_table(q4_macro.loc[q4_macro['scenario'].eq('extreme_q95') & q4_macro['horizon'].isin([6, 12])].sort_values(['outcome', 'horizon
']) if not q4_macro.empty else q4_macro, ['scenario', 'outcome_label', 'horizon', 'conditional_response_pctpt', 'joint_lower_95', '
joint_upper_95', 'row_evidence_status'])}

1672

1673 政策压力层只重述 Q3 已实现的 2026 年临时调控关闭反事实，不外推到模拟油价路径。正的“政策缓冲收益”分别表示避免的 PPI/CPI 增幅或避免的工业
活动损失。

1674

1675 {markdown_table(q4_policy.loc[q4_policy['period'].eq('2026-06')].sort_values('outcome') if not q4_policy.empty else q4_policy, ['period',
'outcome_label', 'policy_buffer_benefit_pctpt', 'benefit_lower_95', 'benefit_upper_95', 'evidence_status'])}

1676

1677 SAPR-CVaR 优化层只在 2013-03—2021-12 开发样本上确定阈值和规则，2022-01—2026-06 完全作为隔离检验样本；2026 年战争冲击只用于检验和展示，
不参与规则选择。三档传导率满足 `普通 ≥ 压力 ≥ 极端`，目标函数同时考虑宏观损失、95% CVaR、累计未调价负担和国内调价波动。

1678

1679 {markdown_table(q4_sapr_optimal, ['rule_id', 'rho_normal', 'rho_stress', 'rho_extreme', 'stress_threshold_75_cny_t', '
stress_threshold_95_cny_t', 'J1_macro_loss', 'J2_cvar95_macro_loss', 'J3_avg_gap_month_burden', 'J4_adjustment_volatility', '
max_gap_ratio', 'max_recovery_terminal_gap_ratio'])}

1680

1681 隔离检验样本与 2026 实际冲击情景的策略比较如下。若 SAPR 在检验样本被预注册基线支配，论文必须报告负结果；当前证据状态以 `q4_sapr_summary.
json` 为准。

1682

1683 {markdown_table(q4_sapr_comparison.loc[q4_sapr_comparison['sample_split'].isin(['holdout', 'war_2026'])].sort_values(['sample_split', '
strategy']) if not q4_sapr_comparison.empty else q4_sapr_comparison, ['sample_split', 'strategy', 'rho_normal', 'rho_stress', '
rho_extreme', 'J1_macro_loss', 'J2_cvar95_macro_loss', 'J3_avg_gap_month_burden', 'J4_adjustment_volatility', 'max_gap_ratio', '
max_recovery_terminal_gap_ratio'])}

1684

1685 敏感性检验固定改变阈值、bootstrap 块长和 CPI/IAV 权重，不为追求结论改动样本或目标函数。

1686

1687 {markdown_table(q4_sapr_sensitivity, ['variant', 'rho_normal', 'rho_stress', 'rho_extreme', 'pareto_rule_count', '
holdout_non_dominated_probability', 'changed_from_default'])}

1688

1689 ## 6. 正文扩展证据

1690

1691 新增正文模块不引入新主模型，只把原结果重组为“主张--证据--边界”。Q1扩展输出给定递归SVAR识别下的2026年冲突期结构贡献；若全球供给物理量尚
未审计到后续月份，则只报告可复核月份，不回填。

```

1692
1693 {markdown_table(paper_extension_q1, ['period', 'supply_contribution', 'aggregate_demand_contribution', 'oil_specific_risk_contribution',
1694     'total_model_contribution', 'actual_real_brent_return', 'historical_percentile'])}
1695
1696 Q2扩展矩阵按冲击来源和结果变量报告极值、期限与联合区间状态，防止把所有油价上涨写成同一种经济冲击。
1697
1698 {markdown_table(paper_extension_q2, ['shock_label', 'outcome_label', 'extremum_type', 'extremum_response', 'extremum_month', '
1699     joint_interval_crosses_zero', 'direction'], limit=12)}
1700
1701 Q3扩展用临界缩放系数量化中国代理值的不可比程度，仍不得将中国代理值放入正式价格层排名。
1702
1703 {markdown_table(paper_extension_q3, ['scenario', 'critical_kappa_point', 'critical_kappa_bootstrap_median', 'critical_kappa_lower_95', '
1704     critical_kappa_upper_95'])}
1705
1706 最终论文主张按下表限界：该表优先于单个模型的 `PASS` 状态。
1707
1708 {markdown_table(paper_extension_claims, ['claim_id', 'topic', 'evidence_status', 'allowed_claim', 'forbidden_claim'], limit=6)}
1709
1710 ## 7. 图表与冻结文件
1711
1712 核心 PNG 图表：{'', '.join(figures) if figures else '暂无图表'}。
1713
1714 冻结文件：
1715
1716 - `results/final_numbers.json`
1717 - `results/frozen_numbers.json`
1718 - `results/risk_probe_summary.json`
1719 - `results/reproducibility_manifest.json`
1720
1721 其中 `frozen_numbers.json` 遵循 `3coding-visual` 标准冻结格式：风险门禁以及代码、输入、输出文件哈希保存在独立的 reproducibility manifest
1722 中。数值一致性使用标准 skill 脚本检查，项目级文件与环境检查使用 `python code/utlils/verify_freeze.py`。
1723
1724 ## 8. Warnings
1725
1726 {chr(10).join(warning_lines)}
1727
1728 ## 9. 论文使用建议
1729
1730 {paper_advice}
1731
1732 """

附录 D 证据解释边界

- *ARBaselineGap*是战前AR规律的描述性差额，不是战争净因果贡献。
- Q2联合区间跨零时，不将点估计写成稳健总体增长损失；响应曲线面积不是累计损失。
- Q3跨国韧性总体为结论不充分；中国燃油序列是调价指数代理。
- Q3政策结果是局部动态代理情景；未经审计年度缓冲代理没有定量结论。
- Q4尾部概率是固定信息集下的条件概率；结构压力和政策反事实不可相加。
- SAPR只在注册规则族内最优；平均缺口月负担不等于财政支出或完整福利损失。
